²Université de Nice Sophia-Antipolis

Exact controllability for the waves

$$(W) \quad \begin{cases} \partial_t^2 u - \Delta u = 0 & \text{in }]0, +\infty[\times M \\ (u(0), \partial_t u(0)) = U_0 = (u_0, u_1) \in H^1 \times L^2 \end{cases}$$

Exact controllability for the waves

$$(W) \quad \begin{cases} \partial_t^2 u - \Delta u = 0 & \text{in }]0, +\infty[\times M \\ (u(0), \partial_t u(0)) = U_0 = (u_0, u_1) \in H^1 \times L^2 \end{cases}$$

- M Riemannian manifold, connected, compact, without boundary, with dimension d
(ex: sphere, torus...)

Exact controllability for the waves

$$(W) \quad \begin{cases} \partial_t^2 u - \Delta u = 0 & \text{in }]0, +\infty[\times M \\ (u(0), \partial_t u(0)) = U_0 = (u_0, u_1) \in H^1 \times L^2 \end{cases}$$

- M Riemannian manifold, connected, compact, without boundary, with dimension d
(ex: sphere, torus...)
- $M = \Omega$ open subset of \mathbb{R}^d , connected, bounded and smooth
(homogeneous Dirichlet condition on the boundary)

Exact controllability for the waves

$$(W) \quad \begin{cases} \partial_t^2 u - \Delta u = 0 & \text{in }]0, +\infty[\times M \\ (u(0), \partial_t u(0)) = U_0 = (u_0, u_1) \in H^1 \times L^2 \end{cases}$$

- M Riemannian manifold, connected, compact, without boundary, with dimension d
(ex: sphere, torus...)
- $M = \Omega$ open subset of \mathbb{R}^d , connected, bounded and smooth
(homogeneous Dirichlet condition on the boundary)

$$E = C([0, +\infty[, H^1) \cap C^1([0, +\infty[, L^2)$$

Exact controllability for the waves

$$(W) \quad \begin{cases} \partial_t^2 u - \Delta u = 0 & \text{in }]0, +\infty[\times M \\ (u(0), \partial_t u(0)) = U_0 = (u_0, u_1) \in H^1 \times L^2 \end{cases}$$

- M Riemannian manifold, connected, compact, without boundary, with dimension d
(ex: sphere, torus...)
- $M = \Omega$ open subset of \mathbb{R}^d , connected, bounded and smooth
(homogeneous Dirichlet condition on the boundary)

$$E = C([0, +\infty[, H^1) \cap C^1([0, +\infty[, L^2)$$

ω open subset of M and $T > 0$ (suitable)

The Goal

$$(v_0, v_1) \in E = H^1 \times L^2$$

Find a source $f(t, x) \in L^2_{loc}([0, +\infty[, L^2)$, $\text{supp } f \subset \omega$

$$\begin{cases} \partial_t^2 u - \Delta u = f \\ U_0 = (u_0, u_1) \end{cases}$$

$$(u(T), \partial_t u(T)) = U(T) = (v_0, v_1)$$

The Goal

$$(v_0, v_1) \in E = H^1 \times L^2$$

Find a source $f(t, x) \in L^2_{loc}([0, +\infty[, L^2)$, $\text{supp } f \subset \omega$

$$\begin{cases} \partial_t^2 u - \Delta u = f \\ U_0 = (u_0, u_1) \end{cases}$$

$$(u(T), \partial_t u(T)) = U(T) = (v_0, v_1)$$

$$(u_0, u_1) \rightarrow (v_0, v_1)$$

By linearity

$$(0, 0) \rightarrow (u_0, u_1)$$

The Goal

$$(v_0, v_1) \in E = H^1 \times L^2$$

Find a source $f(t, x) \in L^2_{loc}([0, +\infty[, L^2)$, $\text{supp } f \subset \omega$

$$\begin{cases} \partial_t^2 u - \Delta u = f \\ U_0 = (u_0, u_1) \end{cases}$$

$$(u(T), \partial_t u(T)) = U(T) = (v_0, v_1)$$

$$(u_0, u_1) \rightarrow (v_0, v_1)$$

By linearity

$$(0, 0) \rightarrow (u_0, u_1)$$

$$A : (u_0, u_1) \rightarrow f$$

$$f = \chi(x)g \approx \mathbf{1}_\omega g$$

The HUM method

$$f = \chi(x)g \approx \mathbf{1}_\omega g$$

$$\begin{cases} \partial_t^2 g - \Delta g = 0 \\ G(T) = G_0 = (g_0, g_1) \in E_{-1} = L^2 \times H^{-1} \end{cases}$$

And we solve

$$\begin{cases} \partial_t^2 u - \Delta u = \chi(x)g \\ U(0) = (0, 0) \end{cases}$$

$$f = \chi(x)g \approx \mathbf{1}_\omega g$$

$$\begin{cases} \partial_t^2 g - \Delta g = 0 \\ G(T) = G_0 = (g_0, g_1) \in E_{-1} = L^2 \times H^{-1} \end{cases}$$

And we solve

$$\begin{cases} \partial_t^2 u - \Delta u = \chi(x)g \\ U(0) = (0, 0) \end{cases}$$

$$\begin{cases} S : E_{-1} \rightarrow E \\ G_0 \rightarrow (u(T), \partial_t u(T)) \end{cases}$$

The HUM method

$$f = \chi(x)g \approx \mathbf{1}_\omega g$$

$$\begin{cases} \partial_t^2 g - \Delta g = 0 \\ G(T) = G_0 = (g_0, g_1) \in E_{-1} = L^2 \times H^{-1} \end{cases}$$

And we solve

$$\begin{cases} \partial_t^2 u - \Delta u = \chi(x)g \\ U(0) = (0, 0) \end{cases}$$

$$\begin{cases} S : E_{-1} \rightarrow E \\ G_0 \rightarrow (u(T), \partial_t u(T)) \end{cases}$$

$$\int_M (\overline{g_0} \partial_t u(T) - \overline{g_1} u(T)) dx = \int_0^T \int_M \chi(x) |g|^2 dx dt$$

$$\langle G_0, SG_0 \rangle_{E_{-1}, E} = \int_0^T \int_M \chi(x) |g|^2 dx dt$$

Observation

$$\int_0^T \int_M \chi(x) |g|^2 dx dt \geq C \|G_0\|_{E_{-1}}^2$$
$$\|SG_0\|_E \geq C \|G_0\|_{E_{-1}} \quad \text{and} \quad S : E_{-1} \leftrightarrow E$$

Observation

$$\int_0^T \int_M \chi(x) |g|^2 dx dt \geq C \|G_0\|_{E_{-1}}^2$$

$$\|SG_0\|_E \geq C \|G_0\|_{E_{-1}} \quad \text{and} \quad S : E_{-1} \leftrightarrow E$$

Conclusion: For $U_0 \in E = H^1 \times L^2$, we find a control $f = \chi(x)g \in L^1([0, T], L^2)$.

Observation

$$\int_0^T \int_M \chi(x) |g|^2 dx dt \geq C \|G_0\|_{E_{-1}}^2$$

$$\|SG_0\|_E \geq C \|G_0\|_{E_{-1}} \quad \text{and} \quad S : E_{-1} \leftrightarrow E$$

Conclusion: For $U_0 \in E = H^1 \times L^2$, we find a control $f = \chi(x)g \in L^1([0, T], L^2)$.

→ The controlled solution $U(t) = (u, \partial_t u) \in E = H^1 \times L^2$

Observation

$$\int_0^T \int_M \chi(x) |g|^2 dxdt \geq C \|G_0\|_{E_{-1}}^2$$

$$\|SG_0\|_E \geq C \|G_0\|_{E_{-1}} \quad \text{and} \quad S : E_{-1} \leftrightarrow E$$

Conclusion: For $U_0 \in E = H^1 \times L^2$, we find a control $f = \chi(x)g \in L^1([0, T], L^2)$.

→ The controlled solution $U(t) = (u, \partial_t u) \in E = H^1 \times L^2$

Remark: This HUM control is solution of a variational problem: it's the only one that minimizes

$$\int_0^T \int_\omega |f|^2 dxdt$$

Observation

$$\int_0^T \int_M \chi(x) |g|^2 dxdt \geq C \|G_0\|_{E_{-1}}^2$$

$$\|SG_0\|_E \geq C \|G_0\|_{E_{-1}} \quad \text{and} \quad S : E_{-1} \leftrightarrow E$$

Conclusion: For $U_0 \in E = H^1 \times L^2$, we find a control $f = \chi(x)g \in L^1([0, T], L^2)$.

→ The controlled solution $U(t) = (u, \partial_t u) \in E = H^1 \times L^2$

Remark: This HUM control is solution of a variational problem: it's the only one that minimizes

$$\int_0^T \int_\omega |f|^2 dxdt$$

Definition: We will call HUM control operator the operator Λ defined from E into E_{-1} by

$$G_0 = \Lambda U_0$$

Two problems

a) Control of smooth data

$$U_0 \in E_k = H^{k+1} \times H^k, \quad k \geq 0$$

Two problems

a) Control of smooth data

$$U_0 \in E_k = H^{k+1} \times H^k, \quad k \geq 0$$

→ Does the control ΛU_0 recognize the data regularity ?

→ Does it adjust itself automatically ?

a) Control of smooth data

$$U_0 \in E_k = H^{k+1} \times H^k, \quad k \geq 0$$

- Does the control ΛU_0 recognize the data regularity ?
- Does it adjust itself automatically ?
- What about the wave front ?

$$WF_k(\Lambda U_0) = WF_{k+1} U_0 \quad ?$$

Two problems

a) Control of smooth data

$$U_0 \in E_k = H^{k+1} \times H^k, \quad k \geq 0$$

- Does the control ΛU_0 recognize the data regularity ?
- Does it adjust itself automatically ?
- What about the wave front ?

$$WF_k(\Lambda U_0) = WF_{k+1} U_0 \quad ?$$

Bardos-Lebeau-Rauch (92') : Observation in each $H^s(M)$.

Two problems

a) Control of smooth data

$$U_0 \in E_k = H^{k+1} \times H^k, \quad k \geq 0$$

- Does the control ΛU_0 recognize the data regularity ?
- Does it adjust itself automatically ?
- What about the wave front ?

$$WF_k(\Lambda U_0) = WF_{k+1} U_0 \quad ?$$

Bardos-Lebeau-Rauch (92') : Observation in each $H^s(M)$.

b) Treatment of the frequencies

- Does the control ΛU_0 load the frequencies carrying the data ?
- If U_0 has only low frequencies, how are the high frequencies of ΛU_0 ?
- Does it handle individually the frequencies of the data U_0 ?

Control of nonlinear equations

Time is money !

$$\partial_t^2 u - \Delta u + f(u) = 0$$

Control of nonlinear equations

Time is money !

$$\partial_t^2 u - \Delta u + f(u) = 0$$

→ f lipschitz : control to zero, in uniform time, of small datas (Zuazua 92').

Control of nonlinear equations

Time is money !

$$\partial_t^2 u - \Delta u + f(u) = 0$$

→ f lipschitz : control to zero, in uniform time, of small datas (Zuazua 92').

→ f subcritical: stabilization → small datas....: non uniform control time

(Dehman-Lebeau-Zuazua 03') et (Dehman-Gérard-Lebeau 06' for Schrödinger).

Control of nonlinear equations

Time is money !

$$\partial_t^2 u - \Delta u + f(u) = 0$$

→ f lipschitz : control to zero, in uniform time, of small datas (Zuazua 92').

→ f subcritical: stabilization → small datas....: non uniform control time

(Dehman-Lebeau-Zuazua 03') et (Dehman-Gérard-Lebeau 06' for Schrödinger).

Program

→ Sharp analysis of the control operator $\Lambda : E \rightarrow E_{-1}$

→ Quantification of Λ .

An abstract control

→ $\exp(itA)$, $t \geq 0$, a semi-group of contractions on a hilbert space H .

→ B bounded operator on H and $g \in L^1([0, T], H)$

$$(\partial_t - iA)f = Bg, \quad f(0) = 0$$

$$f(T) = \int_0^T e^{i(T-t)A} Bg(t) dt$$

We choose g solution of

$$(\partial_t - iA^*)g = 0, \quad g(T) = g_0$$

Observation

$$\int_0^T \left\| B^* e^{-itA^*} h \right\|_H^2 dt \geq C \|h\|_H^2$$

The HUM optimal control is given by

$$g(t) = B^* e^{-i(T-t)A^*} g_0$$

$$f_0 = f(T) = M_T g_0$$

$$M_T = \int_0^T e^{i(T-t)A} B B^* e^{-i(T-t)A^*} dt = \int_0^T e^{itA} B B^* e^{-itA^*} dt$$

If A is self-adjoint

$$M_T = \int_0^T e^{itA} B B^* e^{-itA} dt = \Lambda^{-1}$$

$$m(t) = e^{itA} B B^* e^{-itA}$$

Notations

$M = \Omega$ open bounded, connected and smooth subset of \mathbb{R}^d .

$(e_j, \omega_j^2)_{j \geq 1}$ the spectral elements of Ω .

$$-\Delta e_j = \omega_j^2 e_j, \quad e_j|_{\partial\Omega} = 0, \quad \|e_j\|_{L^2(\Omega)} = 1$$

$$H^s(\Delta) = \left\{ u = \sum_j a_j e_j, \quad \sum_j (1 + \omega_j^2)^s |a_j|^2 < \infty \right\}$$

$$\lambda = \lambda(x, D_x) = \sqrt{|\Delta|}$$

$$\lambda(x, D_x) \sum_j a_j e_j = \sum_j \omega_j a_j e_j$$

If M is a compact manifold without boundary, it is a pseudo-differential operator of order 1 (Helffer-Sjöstrand formula).

Littlewood-Paley Decomposition

Let $\varphi \in C_0^\infty(\mathbb{R})$, and $\psi \in C_0^\infty(\mathbb{R}^*)$ such that

$$\varphi(s) + \sum_{k=1}^{\infty} \psi(2^{-k}s) = 1, \quad s \in \mathbb{R}$$

$$\begin{cases} \psi_0(s) = \varphi(s) \\ \psi_k(s) = \psi(2^{-k}s), \end{cases} \quad k \geq 1$$

Littlewood-Paley Decomposition

Let $\varphi \in C_0^\infty(\mathbb{R})$, and $\psi \in C_0^\infty(\mathbb{R}^*)$ such that

$$\varphi(s) + \sum_{k=1}^{\infty} \psi(2^{-k}s) = 1, \quad s \in \mathbb{R}$$

$$\begin{cases} \psi_0(s) = \varphi(s) \\ \psi_k(s) = \psi(2^{-k}s), \end{cases} \quad k \geq 1$$

Spectral localization operators

$k \in \mathbb{N}$, $u = \sum_j a_j e_j$,

$$\psi_k(D)u = \sum_j \psi_k(\omega_j) a_j e_j = \sum_j \psi(2^{-k}\omega_j) a_j e_j$$

$$S_k(D) = \sum_{j=0}^k \psi_j(D) = \psi_0(2^{-k}D), \quad k \geq 0$$

→ If M is compact, these are pdo of order 0

→ They commute to the laplacian.

Time dependant control

$$\begin{cases} \partial_t^2 u - \Delta u = \chi g \\ U_0 = (0, 0) \end{cases}$$

$\chi(t, x) = \varphi(t)\chi_0(x)$ in $C^\infty(\mathbb{R} \times \overline{\Omega})$,
 φ flat at $t = 0, T$ and $\varphi > 0$ in $]0, T[$.

$$\omega = \{x \in \Omega, \chi_0(x) \neq 0\}$$

Time dependant control

$$\begin{cases} \partial_t^2 u - \Delta u = \chi g \\ U_0 = (0, 0) \end{cases}$$

$\chi(t, x) = \varphi(t)\chi_0(x)$ in $C^\infty(\mathbb{R} \times \overline{\Omega})$,
 φ flat at $t = 0, T$ and $\varphi > 0$ in $]0, T[$.

$$\omega = \{x \in \Omega, \chi_0(x) \neq 0\}$$

Geometric Control Condition (GCC)

ω satisfies (GCC) at time T if every geodesic ray of Ω travelling with speed 1 and starting at $t = 0$, enters the open set ω in a time $t < T$.

$$E = H_0^1 \times L^2 \leftrightarrow L^2 \otimes L^2$$

$$u_0 = \lambda^{-1}(h_+ + h_-), \quad u_1 = i(h_+ - h_-)$$

$$A = \begin{pmatrix} \lambda & 0 \\ 0 & -\lambda \end{pmatrix} \quad B = \frac{1}{2i} \begin{pmatrix} \chi & \chi \\ -\chi & -\chi \end{pmatrix}$$

$$(\partial_t - iA)f = Bg, \quad f(0) = 0$$

$$M_T = \frac{1}{2} \int_0^T \begin{pmatrix} e^{it\lambda} \chi^2 e^{-it\lambda} & -e^{it\lambda} \chi^2 e^{it\lambda} \\ -e^{-it\lambda} \chi^2 e^{-it\lambda} & e^{-it\lambda} \chi^2 e^{it\lambda} \end{pmatrix} dt = \frac{1}{2} \begin{pmatrix} Q_+ & T_+ \\ T_- & Q_- \end{pmatrix}$$

$$Q_{\pm} = \int_0^T e^{\pm it\lambda} \chi^2 e^{\mp it\lambda} dt, \quad T_{\pm} = - \int_0^T e^{\pm it\lambda} \chi^2 e^{\pm it\lambda} dt$$

Statement of the results

Theorem 1: Quantification of Λ

Under (GCC), Q_{\pm} is an isomorphism on $H^s(\Delta)$ for every $s \geq 0$ and

$$T_{\pm} : H^s(\Delta) \rightarrow H^{s+1}(\Delta)$$

Moreover, with $L_{\pm} = Q_{\pm}^{-1}$

$$\Lambda = \begin{pmatrix} 2L_+ & 0 \\ 0 & 2L_- \end{pmatrix} + R$$

where R is smoothing.

In particular Λ is an isomorphism on $H^s(\Delta) \otimes H^s(\Delta)$.

Statement of the results

Theorem 1: Quantification of Λ

Under (GCC), Q_{\pm} is an isomorphism on $H^s(\Delta)$ for every $s \geq 0$ and

$$T_{\pm} : H^s(\Delta) \rightarrow H^{s+1}(\Delta)$$

Moreover, with $L_{\pm} = Q_{\pm}^{-1}$

$$\Lambda = \begin{pmatrix} 2L_+ & 0 \\ 0 & 2L_- \end{pmatrix} + R$$

where R is smoothing.

In particular Λ is an isomorphism on $H^s(\Delta) \otimes H^s(\Delta)$.

Theorem 2: Under (GCC),

$$\|\psi_k(D)\Lambda - \Lambda\psi_k(D)\|_{L^2} \leq c2^{-k}$$

$$\|S_k(D)\Lambda - \Lambda S_k(D)\|_{L^2} \leq c2^{-k}$$

Remarks

- 1 Finally, the HUM control Λ preserves automatically the regularity of the data to be controlled.
- 2 Λ acts almost individually on each frequency block of the solution.
- 3 Λ has a pseudo-differential behavior.
- 4 $(e_n, e_n) \rightarrow (e_{n+1}, e_{n+1})$: the control vector and the controlled solution live at frequency ω_n , for n large enough.
- 5 Numerical applications: G.Lebeau-M.Nodet (08').

Case of a compact manifold without boundary

$(e_j, \omega_j^2)_{j \geq 0}$ the spectral elements of M .

$$\Pi_+ \sum_{j \geq 0} a_j e_j = \sum_{j \geq 1} a_j e_j$$

For $(x, \xi) \in T^*M \setminus 0$, we denote

$$\gamma(s) = \gamma_{(x, \xi)}(s), \quad s \in \mathbb{R}$$

the bicharacteristic of the wave operator starting from (x, ξ) .

$$\alpha(x, \xi) = \left(\int_0^T \chi^2(\gamma(s)) ds \right)^{-1}$$

$$\beta(x, \xi) = \alpha(x, -\xi)$$

Under (GCC), these are elliptic pseudo-differential symbols of order 0.

Theorem 3

Under (GCC), Λ is an elliptic pseudo-differential operator of order 0,

$$\Lambda = \Pi_+ \begin{pmatrix} 2\alpha(x, D) & 0 \\ 0 & 2\beta(x, D) \end{pmatrix} \Pi_+ + R$$

where R is a smoothing pdo.

→ Λ is an isomorphism on $H^s(M) \otimes H^s(M)$.

→ Notice the explicit reading of the (GCC).

→ Key: Egorov theorem

Theorem 3

Under (GCC), Λ is an elliptic pseudo-differential operator of order 0,

$$\Lambda = \Pi_+ \begin{pmatrix} 2\alpha(x, D) & 0 \\ 0 & 2\beta(x, D) \end{pmatrix} \Pi_+ + R$$

where R is a smoothing pdo.

→ Λ is an isomorphism on $H^s(M) \otimes H^s(M)$.

→ Notice the explicit reading of the (GCC).

→ Key: Egorov theorem

Corollary : With the same assumptions, if $U_0 = (u_0, u_1)$ and $G_0 = (g_0, g_1) = \Lambda U_0$, $s \geq 0$,

$$WF_{s+1}(u_0) \cup WF_s(u_1) = WF_s(g_0) \cup WF_{s-1}(g_1)$$

→ Λ is microlocal.

→ Analogous result on a domain Ω of \mathbb{R}^d by G.Lebeau-J.Rauch (work in progress).

Semilinear wave equation

$M = \Omega$ open, bounded and smooth subset of \mathbb{R}^3 , $1 \leq p < 5$
 $f : \mathbb{R} \rightarrow \mathbb{R}$, of class C^3 , $f(0) = 0$, $sf(s) \geq 0 \quad \forall s \in \mathbb{R}$

$$\left| f^{(j)}(s) \right| \leq C(1 + |s|)^{p-j}, \quad \text{for } j = 1, 2, 3$$

Theorem 4: Semilinear waves

Under condition (GCC), for every $C_0 > 0$, there exist $r > 0$ and $k \in \mathbb{N}$, s.t for every U_0, U_1 satisfying

$$\begin{aligned} \|U_0\|_{H_0^1 \times L^2} &\leq C_0, & \|U_1\|_{H_0^1 \times L^2} &\leq C_0 \\ \|S_k(D)U_0\|_{H_0^1 \times L^2} &\leq r, & \|S_k(D)U_1\|_{H_0^1 \times L^2} &\leq r \end{aligned}$$

there exists $g \in L^1(0, T; L^2)$ which exactly controls the semilinear wave equation at time T , namely, the unique solution of system

$$\begin{cases} \square u + f(u) = \chi g & \text{sur } \Omega, & u|_{\partial\Omega} = 0 \\ (u(0), \partial_t u(0)) = U_0 \end{cases}$$

satisfies $U(T) = U_1$.

Remarks

- 1- The low frequencies determine the nonlinear behavior of the equation.
- 2- For high frequencies, we have a "linear behavior".
- 3- The control process is achieved in uniform time: the one of linear control.
- 4- Condition on LF energy ? Open problem.
- 5- Method of proof: Fixed point process used near the linear control.
- 6- Main tools: Strichartz estimates and analysis of LF of the linear control.

Remarks

- 1- The low frequencies determine the nonlinear behavior of the equation.
- 2- For high frequencies, we have a "linear behavior".
- 3- The control process is achieved in uniform time: the one of linear control.
- 4- Condition on LF energy ? Open problem.
- 5- Method of proof: Fixed point process used near the linear control.
- 6- Main tools: Strichartz estimates and analysis of LF of the linear control.

Key lemma : Regularity of the nonlinear term

Remarks

- 1- The low frequencies determine the nonlinear behavior of the equation.

- 3- The control process is achieved in uniform time: the one of linear control.
- 4- Condition on LF energy ? Open problem.
- 5- Method of proof: Fixed point process used near the linear control.
- 6- Main tools: Strichartz estimates and analysis of LF of the linear control.

Key lemma : Regularity of the nonlinear term

Corollary: In the same framework, if (U_0^n) and (U_1^n) are two sequences of data weakly converging to zero in $H_0^1 \times L^2$, one can drive one of them to the other, by the semilinear wave evolution, at geometric control time. In particular, one can drive (U_0^n) to 0.

Proof of Theorem 1

$$(\Lambda^{-1}) = M_T = \frac{1}{2} \begin{pmatrix} Q_+ & T_+ \\ T_- & Q_- \end{pmatrix}$$

$$Q_+ = \int_0^T e^{it\lambda} \chi^2 e^{-it\lambda} dt, \quad T_+ = - \int_0^T e^{it\lambda} \chi^2 e^{it\lambda} dt$$

Difficulty : χ^2 does not operate on the Sobolev spaces $H^s(\Delta)$

1. Q_+ is an isomorphism on L^2 : (GC) + Observation estimate
2. Q_+ is bounded on $H^s(\Delta)$

$$Q_+ = \sum_{i,j} C_{ij}, \quad C_{ij} = \int_0^T e^{it\lambda} \psi_i(D) \chi^2 \psi_j(D) e^{-it\lambda} dt$$

The matrix $(2^{is} \|C_{ij}\|_{L^2 \rightarrow L^2} 2^{-js})$ is bounded on $l^2(\mathbb{N})$.

$$C_{ij} = \int_0^T e^{it\lambda} \lambda^{-1} \psi_i(D) (i\partial_t \chi^2 + \chi^2 \lambda) \psi_j(D) e^{-it\lambda} dt$$

$$2^{is} \|C_{ij}\|_{L^2 \rightarrow L^2} 2^{-js} \leq C_N 2^{-(N-s)|i-j|}, \quad N \geq 1$$

3. Q_+ is an isomorphism on $H^s(\Delta)$

$$u \in L^2 \text{ and } Q_+ u \in H^s(\Delta) \Rightarrow u \in H^s(\Delta)$$

$$F_s = \{u \in L^2 \quad \text{s.t.} \quad Q_+ u \in H^s(\Delta)\}$$

a) $H^s(\Delta)$ is closed in F_s

$$\|u\|_{H^s} \leq c(\|Q_+ u\|_{H^s} + \|u\|_{L^2}) \quad \forall u \in H^s(\Delta)$$

b) $H^s(\Delta)$ is dense in F_s (regularization).

Lemma 1: For $a(x) \in C^\infty(\overline{\Omega})$,

$$\left\| [\psi_j(D), a(x)] \right\|_{L^2 \rightarrow L^2} \leq c2^{-j}$$

Lemma 2:

- i) The bracket $[Q_+, \lambda^{-s}]$ is bounded from L^2 to $H^{s+1}(\Delta)$ for $s \in [0, 2[$.
- ii) The bracket $[Q_+, \lambda]$ is bounded on L^2 .
- iii) For every $s \geq 0$, the operator

$$A_s = \lambda^s Q_+ \lambda^{-s} - Q_+$$

is bounded from L^2 to $H^{1/2}(\Delta)$.

In particular, A_s is compact on L^2 .

$$f(u) = f'(0)u + \theta(u)$$

$$\begin{cases} \square u + f(u) = \chi^2(g_1 + g_2) \\ U_0 \in H_0^1 \times L^2 \end{cases}$$

$$\square g_1 + f'(0)g_1 = 0 \text{ and } G_1(0) = \Lambda(U_0, U_1)$$

$$u = v + w$$

$$\square v + f'(0)v = \chi^2 g_1 \text{ and } V(0) = U_0$$

then $V(T) = U_1$

$$\square w + f'(0)w = -\theta(u) + \chi^2 g_2 \text{ and } W(0) = 0$$

Let h be solution of

$$\square h + f'(0)h = \theta(u) \quad \text{and} \quad H(T) = 0$$

The function $k = w + h$ is solution of

$$\square k + f'(0)k = \chi^2 g_2 \quad \text{and} \quad K(0) = H(0)$$

→ Now, the goal is to control this linear system

$$H(0) \rightarrow 0$$

∃? $G_2 \in L^2 \times H^{-1}$ such that

$$AG_2 = H(0) = K(0) = \Lambda^{-1}G_2$$

→ Fixed point in $L^2 \times H^{-1}$ for $L = \Lambda A$

→ L is compact and reproduces a small ball B_ρ centred at the origin of $L^2 \times H^{-1}$.

Egorov Theorem

$$\begin{cases} \partial_t u = iA(x; D_x)u & \text{in } \mathbb{R} \times M \\ u(0) = u_0 \end{cases}$$

→ $A = A_1 + A_0$, $A_1(x; \xi) \in S_{cl}^1$ real, $A_0(x; \xi) \in S_{cl}^0$

→ $A_1(x; \xi)$ homogeneous in ξ for $|\xi| \geq 1$

$$u(t, x) = \mathcal{U}(t)u_0$$

$\mathcal{U}(t)$ is bounded on each $H^\sigma(M)$, with inverse $\mathcal{U}(-t)$.

Egorov Theorem

If $P_0 = p_0(x, D) \in OPS_{1,0}^m$, then for every t , the operator

$$P(t) = \mathcal{U}(t)P_0\mathcal{U}(-t)$$

belongs to $OPS_{1,0}^m$, modulo a smoothing operator. The principal symbol of $P(t)$ (mod $S_{1,0}^{m-1}$) at (x_0, ξ_0) is equal to $p_0(\gamma(t))$ where γ is the bicharacteristic of A_1 issued from (x_0, ξ_0) .

Strichartz Inequalities

Theorem (Burq-Lebeau-Planchon 07'): For every $T > 0$ and $E_0 > 0$, the system

$$\begin{cases} \square u + f(u) = g & \text{in }]0, +\infty[\times \Omega \\ u = 0 & \text{on }]0, +\infty[\times \partial\Omega \\ \|u(0)\|_{H_0^1} + \|\partial_t u(0)\|_{L^2} \leq E_0 \end{cases}$$

admits a unique solution u in the class $C^0(0, T; H_0^1(\Omega)) \cap C^1(0, T; L^2(\Omega))$ satisfying

$$\|u\|_{L^5(0, T; W^{10,5})} \leq C$$

for some $C = C(T, E_0, \|g\|_{L^1(0, T; L^2)})$.

In particular, for every $q \in [5, +\infty]$, $\exists C' > 0$,

$$\|u\|_{L^q(0, T; L^{3r})} \leq C'$$

with $1/q + 1/r = 1/2$.

Examples: $L^\infty(L^6)$, $L^5(L^{10})$, $L^8(L^8)$, ...

Composition theorem

If $v(t, x) \in L^5(0, T; W^{\frac{3}{10}, 5}(\Omega))$ then $f(v) \in L^1(0, T; H^\mu(\Omega))$, with $\mu = \frac{3}{10}(5 - p)$.

CINQUIEME COLLOQUE TUNISO-FRANCAIS D'EQUATIONS AUX DERIVEES PARTIELLES

Première Annonce

Date: Du 28 Septembre au 2 Octobre 2009.

Lieu: Hammamet, Tunisie.

Environ 22 conférences prévues.

Organisateurs: M.Bellassoued (F.S.Bizerte), B.Dezman (F.S.Tunis), C.Zuily, N.Burq (Univ. Paris Sud) et P.Raphael (Univ. Paul Sabatier, Toulouse).

Organisation locale: M.Bellassoued, A.Atallah-Baraket et B.Dezman.

Contacts: bellassoued@yahoo.fr
Belhassen.Dezman@fst.rnu.tn
